

MOBEYE APPLICATION SHEET

Applications in security and alarming

MOBEYE

Temperature monitoring and heat control

Versatile temperature alarm and remote control

In the winter the heater is essential. The heater prevents frozen pipes and provides comfort. Once the outside temperature drops it is advisable to check the operation of the heater. Frost damage can be a valuable disappointment.

The Mobeye MS200E helps you: it alerts at temperature problems and power failure. In addition, the MS200E offers comfort by allowing you to set the heater remotely. Finally, the MS200E can also be used as a thermostat.

Mobeye MS200E

MS200E GSM alarm messenger, with external temperature sensor additional (NO/NC) inputs and outputs, generating temperature alarm, power outage alerts and control.

Security and comfort are made easy!

How it works

Alarming

- The MS200E is your frost guard. After setting up the lower and upper temperature limit, the MS200E will generate alarm messages if the ambient temperature exceeds the limits.
- By plugging the adapter into a socket, you are also alerted in case of a power failure.

Control

- It is possible to switch the heater remotely, so that you are stepping into a nice warm house. Just connect the outputs of the MS200E to the heater and set the number that are 'authorised' to switch the heater remotely.

Thermostat function

- The MS200E can be used in order to keep the temperature in a space at a certain height. At a low temperature the MS200E turns the heater. Once the target temperature is reached, it switches off.
