

MOBEYE APPLICATION SHEET

Applications in security and alarming

MOBEYE Alarm and registration of power failure

No power outage remains unattended

In your key applications you might need to receive an alarm notification in the event of a power outage. In this way critical devices or infrastructure can be monitored, such as the power supply to ATM machines. The Mobeye PowerGuard is a very practical and reliable solution. By simply connecting the adapter to the mains, it is possible to be alarmed about power failure directly or after a preset time delay.

The Mobeye Internet Portal is an optional extension of the functionality. If a registration and a log of the power outages is desired, a link to the Mobeye internet Portal is a perfect solution. The power failures events are recorded, including the duration. The portal will also send messages per e-mail and/or SMS, after an alarm, change of status and missed 'keep-alive' message.

Security made easy!

Mobeye power alarm

PowerGuard (CM2100)

- Notifies per call and/or SMS message upon a power failure

Optional: connection to the Mobeye Internet Portal

- records the alarm events
- Dispatches alarm and technical alerts (e-mail and/or SMS)
- Monitors the communication ('keep alive') and warns upon a communication failure
