Applications for measuring, control and alerts

## MOBEYE

### GSM OUTDOOR ALARM

Guard the garden and keep burglars out

Shouldn't intruders be stopped outside? Securing your garden or outside area is even more effective as an indoor alarm system. A good fence and good lighting is a must. But if someone does enter the garden, you surely want to know this. The Mobeye Outside detector CMVXI-R uses the reliable Optex detector, combined with low power Mobeye GSM technology. No wiring is required. The detector has two motion sensors and is therefore immune to cats, leaves, sunlight, etcetera. Once the alarm is activated you will receive a notification (SMS/e-mail) to take and can take immediate action.

*Leave your home or go to bed with a peace of mind!*

#### Mobeye CMVXI-R

The Mobeye Outdoor alarm is a flexible all-in-one GSM PIR (double) movement detector, with integrated tag reader and GSM communicator. Battery life time of the complete detector is about a year.

The Mobeye Outdoor alarm includes batteries and two (enrolled) tags. More tags can be enrolled.

#### How it works

- Insert a SIM card and batteries. The contact persons are programmed in some easy steps.
- For the best detection the Outdoor Alarm detector is mounted at a height between 0,8 and 1,2 meter. The angle and distance can be adjusted by you (max. 12 meter).
- (Dis) arming is done by a tag, or automatically via time schedule (e.g. a week and weekend schedule).
- If people enter the garden, it will send an SMS text message and call (ma. 5 persons). If a person confirms the call, the other will not receive the call afterwards. Easy security!
- It is your choice to use your own SIM card, or use the Mobeye SIM card and get the extra functionality of the web-based portal.
